C-4	Accidental Deaths Showing Vehicle Involved in Transportation Accidents, and Place of Other Accidents, by County and City Where Death Occurred: North Carolina, 1967.....	81

GUIDE TO TABLES

All entries in this report are shown in the guide below. To locate a specific entry, read down the left hand margin to the desired entry, then follow the line across to find the table or tables containing this entry. For example, population estimates are shown in Tables A-1 and A-3.

[illegible]

1. Marriages, divorces and annulments are classified by place of occurrence only. Accidental deaths (Tables C-3 & C-4) show area where the death occurred. Table B-1 shows births by both area of occurrence and area of residence. Table C-2 shows deaths by both area of occurrence and area of residence. All other tables classify events by place of residence only.

ANNUAL SUMMARY 1967

This volume is the fifty-second annual report of the Public Health Statistics Section of the North Carolina State Board of Health. It contains tabular information regarding North Carolina's population, births, deaths, fetal deaths, marriages, and divorces. Data on reportable communicable diseases are included in a separate report.

Statistics for the state, each county, selected cities, and rural and urban areas are given in this report. It also contains reference information for the years 1920-1967. Tables are presented in three sections:

SECTION A contains population estimates, summary tables of births and deaths, marriages and divorces.

SECTION B contains detailed tables of natality, infant mortality and fetal deaths.

SECTION C contains detailed information on mortality.

Published tables are limited to those of general interest. Additional data are available to qualified research groups and individuals upon request.

North Carolina's vital rates, based on total population, continued essentially the same trends revealed in recent years. The birth rate continued downward, but showed a tendency toward leveling off. The death rate declined from 8.7 to 8.6 per 1,000 population, although numerically there was a slight increase. Marriages and divorces continued their upward trend.

In Table 1 selected vital rates are shown for North Carolina and the United States. North Carolina's birth rate remains slightly higher than the United States rate, but tends to come closer to the national average each year.

Figure 1 depicts annual birth and death rates and the rate of natural increase in population for 1920-1967. The rate of natural increase in 1967 (before migration) was 10.2 per 1,000 population.

Figure 2 shows the annual birth rates, death rates and rates of natural increase for the white and nonwhite populations from 1940 to 1967. The 1967 birth rate per 1,000 population was 23.4 for the nonwhite group and 17.3 for the white group.

BIRTHS

There were 92,600 resident live births in 1967, 127 less than in the preceding year. This is the lowest number of births recorded since 1945. The small rate of decline (0.1) indicates a leveling off in the rather sharp downward trend which has been evident since 1961.

Approximately 96% of all resident births occurred in a hospital and over 97% were attended by a physician. A total of 8,764 infants were prematurely born. In this state a premature infant is defined as an infant weighing 2500 grams (5½ lbs) or less at birth. Births to unmarried mothers totaled 11,162, or 12% of the total births. Table 2 shows the number and per cent of births out of wedlock for the past 8 years, and the increasing proportion of these births among teenage girls.

TABLE 1 SELECTED VITAL RATES PER 1,000 POPULATION OF THE UNITED STATES¹
AND NORTH CAROLINA, 1963 - 1967

TABLE 2
NUMBER AND PER CENT OF TOTAL BIRTHS
OUT-OF-WEDLOCK AND TO MOTHERS UNDER 20:
NORTH CAROLINA, 1960-1967

Year	Births Out-of-Wedlock		Births Out-of-Wedlock to Mothers under 20	
	Number	Per Cent	Number	Per Cent
1960	10,213	9.3	5,254	51.4
1961	10,438	9.3	5,394	51.7
1962	10,595	9.7	5,395	50.9
1963	10,666	9.9	5,612	52.6
1964	11,141	10.5	5,931	53.2
1965	10,970	11.2	6,074	55.4
1966	10,865	11.7	6,168	56.8
1967	11,162	12.1	6,348	56.9

FETAL DEATHS

A fetal death or stillbirth is defined in this state as a fetus which shows no evidence of life after birth has been completed. Only those fetal deaths which have reached the 20th week of gestation are reported to the State Board of Health. There were 1,633 resident fetal deaths reported in 1967, resulting in a ratio of 17.6 per 1,000 live births. The ratio of fetal deaths among unwed mothers was 27.3 per 1,000 live births out-of-wedlock.

DEATHS

Death claimed 42,261 North Carolina residents in 1967, with heart disease, the leading cause, accounting for more than one-third of this total. Deaths from cancer, the second leading cause, continued to increase, particularly neoplasms of the respiratory system. Intracranial vascular lesions (stroke) was the 3rd leading cause, followed by motor vehicle accidents. Figure 3 shows the trend in death rates from motor vehicle accidents and all other accidents since 1920.

INFANT AND MATERNAL MORTALITY

Deaths of infants under one year of age totaled 2,469 in 1967. The rate was 26.7 per 1,000 live births as compared to a rate of 29.0 in 1966. Figure 4 shows annual infant, neonatal (under 28 days) and postneonatal mortality rates by color since 1940. The infant mortality rate among the nonwhite population is approximately double the rate in the white population.

There were 30 deaths from maternal causes in 1967, the lowest number ever recorded for one year. A dramatic decline in these deaths has taken place over the last three decades.

MARRIAGES

There were 45,145 marriages recorded for 1967, an increase of 1,663 over the previous year. The number of marriages has increased steadily since 1962, the year in which central registration of marriages began. In that year 33,968 marriages were recorded.

Resident totals for marriages are not available since there is no interstate reciprocal exchange of these events. There were, however, 10,884 marriages performed in North Carolina in which both bride and groom resided outside the state.

The trend toward younger marriages is illustrated by Table 3, which shows the number and per cent of brides and grooms under 20 years of age for the past five years.

TABLE 3
NUMBER AND PER CENT OF MARRIAGES OF BRIDES
AND GROOMS UNDER 20 YEARS OF AGE:
NORTH CAROLINA, 1963-1967

Year	GROOM		BRIDE	
	Number	Per Cent	Number	Per Cent
1963	5,301	15.0	14,748	41.6
1964	7,798	21.2	17,551	47.7
1965	9,473	23.3	20,023	49.2
1966	11,407	26.2	21,781	50.1
1967	10,866	24.1	21,358	47.3

DIVORCES AND ANNULMENTS

There were 11,983 divorces and annulments of marriage reported in 1967. Of the total number of divorces, the great majority (11,864) were granted on grounds of one-year separation. Divorce figures, like marriages, are available by place of occurrence only.

EXPLANATORY NOTES

Source and Completeness of Data

Tables published in this report are based on records filed with the Office of Vital Statistics of the North Carolina State Board of Health. These records include birth, death, fetal death, and marriage certificates and listings of divorces and annulments granted in North Carolina.

Tables contain all 1967 events received by the Office of Vital Statistics prior to April 1, 1968. In addition to the vital events which occurred in the state, births and deaths which occurred to North Carolina residents in other states are also included in this report. These certificates are reallocated through an interstate exchange provided by the National Center for Health Statistics. It is estimated that less than one per cent of the 1967 events will be reported too late to be included in this report.

The completeness of birth registration was tested in 1940 and 1950 by the United States Bureau of the Census. These tests revealed that North Carolina's birth registration completeness rose from 86.1 per cent in 1940 to 96.1 per cent in 1950. Completeness of reporting has continued to rise since these tests.

Death registration is estimated to be almost 100 per cent complete. This is due not only to the legal requirements but also to the almost universal demand for death certificates in settling estates, collecting insurance benefits, etc. Some under-registration, however, may occur for deaths under one year of age, particularly among those dying in the first day of life.

Fetal death registration is less complete than either births or deaths. North Carolina law requires that a fetal death certificate be filed for a stillborn child of 20 weeks or more gestation; therefore, over two-thirds of the estimated total fetal losses are not required to be reported. In addition, there is assumed to be significant underregistration of reportable fetal deaths, particularly in the 20-27 weeks gestational ages.

Marriage registration was tested in 1963 by the National Center for Health Statistics. This test indicated that "over 99 per cent of issued licenses terminated in a properly recorded marriage".

Divorces and annulments are not registered on official certificates in North Carolina. These events are reported on lists completed by clerks of courts. The completeness of these lists is not known.

Data Collection System

Each month vital records are forwarded to the Office of Vital Statistics from each registration area in North Carolina. Records are received from local registrars, registers of deeds, and clerks of courts.

With a few exceptions, each county is a registration area. The register of deeds is the local custodian of birth and death records, and the local health director serves as registrar in most counties.

The North Carolina Vital Statistics laws require that birth certificates be filed with the local registrar within 5 days by the attending physician, midwife or other person attending the birth. Statutes also require the funeral director or any other person disposing of a body to file a certificate of death or fetal death with the local registrar within 72 hours after death or before burial. The local registrar forwards these records to the Office of Vital Statistics on the fifth day of each month.

Since 1962, certificates of marriage have been required to be filed with the Office of Vital Statistics. The county register of deeds is responsible for filing these records by the fifteenth of the month following the event.

The law directs the clerk of court in which a divorce (or annulment) is granted to report the divorce (or annulment) to the Office of Vital Statistics by the fifteenth of each month.

Classification of Data

The major classifications of birth and death data in this report are: geographic area, color and sex. Certain data are classified by the institution of occurrence and attendant. Births are grouped by age of mother, total-birth order, and birth weight. Fetal deaths are classified by age of mother and attendant. Deaths (excluding fetal deaths) are classified by age group, sex and the "underlying cause of death".

Marriages and divorces are classified by county and month of occurrence. Marriages are further grouped by age of bride and groom, previous marital status and number of previous marriages. Divorces are classified by grounds and number of children.

The 100 counties of North Carolina are the major geographic subdivisions tabulated in this report. Some data are given for cities with a population of 10,000 or more in the 1960 census. Table A-4 gives data for each county by urban and rural areas. Urban is defined as inside the corporate limits of any incorporated place with a population of 2,500 or more in the 1960 census, and rural includes the balance of the county.

Events are assigned to an area on the basis of two criteria, residence and occurrence. Residence is defined as the place where a person lives or maintains his legal residence, and events are assigned to that place regardless of where they occurred. Residence of the mother is used for assigning births and infant deaths. For deaths in hospitals and other institutions, the usual residence prior to admission to the institution is used. Occurrence is defined as the place where the event occurred regardless of the residence of the person. Births and deaths are given by both residence and occurrence. Fetal, infant and maternal deaths are shown by residence only. Marriages, divorces and annulments, and accidental death tables are given by occurrence only. In the accidental death tables it should be noted that the area listed is the place of death. This is not necessarily the same as the place of the accident.

Some events are classified according to the institution of occurrence. The term "hospital" refers

to a general and allied hospital which is defined by the North Carolina Medical Care Commission as a place where two or more non-related individuals reside 24 hours or more on the premises and receive medical care over and above any domiciliary care. Included in all other institutions are the following: tuberculosis and veterans hospitals; physician's offices; mental, chronic, and penal institutions; and domiciliary institutions such as orphanages, rest homes, colleges, etc.

The major racial divisions used in this report are white and nonwhite. With few exceptions the nonwhite class is characteristic of Negroes. North Carolina's population is about 74 per cent white, 25 per cent Negro and about 1 per cent other nonwhite groups. Indians make up the majority of the remaining 1 per cent. There are two concentrations of Indians in North Carolina. One is in and around Swain County in the western mountains and one in Robeson County and nearby southeastern counties.

Age reporting on vital statistics records is subject to some error. There is a tendency for individuals to round ages and consequently there is over reporting of ages ending in the digits 0 and 5. There is a tendency to overstate the ages of very young children, those nearing their 21st and 65th birthdays and those over age 85. From age 22 through middle age there is a tendency to understate age. These errors are partially offset by using age groups in most tabulations.

Cause of death is classified from information in the medical certification section of the death certificate. This portion of the certificate is completed by the attending physician. In the case of an unattended death, the local health director, coroner, or medical examiner is responsible for investigation and certification. The cause selected is the "underlying cause" which is classified according to the 7th revision of the MANUAL OF THE INTERNATIONAL STATISTICAL CLASSIFICATION OF DISEASES, INJURIES, AND CAUSES OF DEATH. Due to prior changes and revision of the rules for classifying the cause of death, data preceding 1949 cannot be accurately compared with that of later years. Comparability ratios for specific causes of death may be obtained upon request.

Method of Estimating Population

Estimates are prepared by the Office of Vital Statistics for the white and nonwhite population of the state, each county and for selected cities with 10,000 population or more in the 1960 census. Population is estimated as of July 1 by the arithmetic or straight line method. This method assumes that each population subdivision (county, city or color group) had an annual numerical increase (or decrease) equal to one tenth the numerical increase (or decrease) recorded between the census years 1950-1960. Past estimates made by this method have proved to be as accurate as any other in reflecting the changes in North Carolina's population. A recent test again confirmed this.

The United States Bureau of the Census conducted a special census in 21 North Carolina counties in November 1965 and January 1966. The total census count in these 21 counties (adjusted to July 1, 1965) was 1,170,266 compared with a straight line estimate of 1,171,105. The difference between the two totals was only 839. Only four of the 21 counties showed a difference of more than 5 per cent between the census count and the estimate. The largest deviation was 7.17 per cent. The average deviation for the 21 counties was 3.16 per cent.

Rates and Ratios

Rates are calculated for births and deaths by dividing the number of events by the estimated midyear population and multiplying the quotient by 1,000. Such rates have not been adjusted for differences in the age, sex, race, rural or urban distribution of the population, or for under-registration or late reporting. These factors plus the limitation of population estimates should be kept in mind when comparing two different areas or time periods.

When reviewing the tables the reader should also keep in mind the limitations of small numbers. There are fluctuations in all statistics which are due to chance. This factor is especially important in categories with small frequencies. Where small frequencies occur slight variations are proportionately large in relation to the base number. For example, small changes in the number of births or deaths in small population groups may make large changes in these rates. For this reason, and because population estimates for small areas are less reliable, rates for cities and counties should be used with caution.

1. Population is estimated as of July 1 except for census years 1920, 1930, 1940, 1950 and 1960 which were enumerated April 1. Population estimates since 1950 were made by the arithmetic or straight line method.
2. Number of births and deaths revised in accordance with national reports published 1920-1963. Births, deaths, infant deaths and maternal deaths by place of residence, 1939-1967; previous years by occurrence. Neonatal deaths by place of residence 1940-1967; previous years by occurrence. Fetal deaths by place of residence 1942-1967; previous years by occurrence.
3. Live birth and death rates per 1,000 population.
Maternal death rates per 10,000 live births.
Infant death rates and fetal death ratios per 1,000 live births.

TABLE A-2 POPULATION, LIVE BIRTHS, TOTAL DEATHS, INFANT, NEONATAL, FETAL AND MATERNAL DEATHS
WITH RATES, BY COLOR: NORTH CAROLINA, 1940-1967

Year	Population	Live Births		Total Deaths Excluding Fetal Deaths		Infant Deaths (Under 1 Yr.)		Neonatal Deaths (Under 28 Days)		Fetal Deaths		Maternal Deaths	
		Number	Rate	Number	Rate	Number	Rate	Number	Rate	Number	Ratio	Number	Rate

OTHER INFORMATION IS AVAILABLE

In addition to this report on North Carolina Vital Statistics, the Public Health Statistics Section prepares many special reports and publishes several other statistical reports. Among those regularly published are:

PROVISIONAL VITAL STATISTICS REPORT: This quarterly report and its annual summary contain current data on births, deaths, marriages and divorces registered in North Carolina, each county, and 35 selected cities.

COMMUNICABLE DISEASE MORBIDITY STATISTICS: This annual report contains yearly totals of reportable communicable disease cases, including tuberculosis and venereal disease, reported in North Carolina and each county.

CANCER ACTIVITY REPORT: This monthly report and its annual summary show the results of screening activities of North Carolina's 20 Cancer Detection Centers and 5 Diagnostic Centers.

Tables published in these reports are limited to those of general interest. The Public Health Statistics Section has more detailed tabulations which are not published but which are available to qualified research groups and individuals.

Requests for additional information should be addressed to:
